

● Features & Improvements

- STATICEXTRA resource type (Issue [#590](#)): **enables ioslots** by adding memory to the main slot (no CPU underutilization)
- **Tarball validation**: warn if DEFAULT_TARBALL_VERSION is missing; investigated 23.0.x default issue (Issue [#513](#))
- **Factory reconfigure scalability**:
 - Avoid loading Condor tarballs into memory (Issue [#601](#))
 - Reuse identical tarballs via deterministic (hash-based) naming (Issue [#603](#))

● Bugfixes

- Container env cleanup (Issue [#592](#)): fixed **inconsistent clearing of PATH**-like variables inside containers
- **RRD upgrade failures** (Issue [#619](#)): resolved NamedTemporaryFile regression causing bad FDs and failed restores
- STATICEXTRA + whole-node (Issue [#612](#)): fixed memory initialization bug preventing slot auto-allocation

● Ongoing:

- Pilot overloading monitoring (Issue [#569](#)):
 - Decide overloading at submission time
 - Record pilot overloading flag in Condor event logs via `job_ad_attributes`
 - Enables accurate efficiency measurements
